☛

First of all West Virginia, West Virginia, and more West Virginia. I have worked on seeing MCHM and PPH at the 0.5 ppb levels (normal level for organics being around 5 ppb) and analyzing split samples. Because with any emergency the desire for results has been if not ASAP then one level less and this has resulted in some weekend work. Biggest challenge has really been the last weekend weather where I missed holding times on samples due to the snow not allowing me to start extractions.

Of course PTs.

A little bit in trying to analyze for 1,4-dioxane.

To sites for Chuck being Progress for Industry and Alcon Research.

Hopefully this year providing assistance for a soil PAH study at multiple different sampling sites throughout Philadelphia to ultimately determine background PAH levels.

Unless you want me to just make up stuff, please give me one or two lines (or more Eric) on what you would like the meeting minutes to reflect on what you are working on.
